

ABSTRACT OF THE DISCLOSURE

A device for binding a boot to a sports article, such as a ski, skate, or snowshoe. The device is of the type having a member for linking to the boot that is capable of being displaced with respect to the sports article between a low position and a high position. For fastening the boot to the device, the linkage member has a front retaining system that cooperates with a front anchoring member of the boot, and a rear retaining system that cooperates with a rear anchoring member. The front retaining system has an opening arrangement to effect the unfastening of the boot from the binding device.
